ITALY · OCTOBER 2026

On Friday, Maria goes home.

She is 84. She fell in her hallway at night and broke her hip. She will go home with a walker.

No one has ever seen the home she is going back to.

Step Wise

Home fall-hazard assessment from phone photos, reviewed by a professional before discharge.

THE PROBLEM

At work, safety is mandatory. At home, it is not.

At work · Legislative Decree 81/2008

- Mandatory risk assessment
- A designated safety officer
- Inspections and penalties

1,189 deaths in 2025

inail.it/content/dam/inail-hub-site/documenti/2026/09/relazione-annuale-inail-2025-nota-stampa-infortuni-mp.pdf

INAIL NOTA PER LA STAMPA

diminuzione del 3,3% rispetto ai 1.239 del 2024 (41 casi in meno). Nel dettaglio si registrano 1.189 denunce mortali per i lavoratori (37 in meno rispetto all'anno precedente) e nove per

INAIL · Annual report 2025 ORIGINAL SOURCE

At home · no rules

- ~~Risk assessment~~
- ~~Safety officer~~
- ~~Inspections~~

~6,000 deaths every year · each square = 10

WHERE FALLS HAPPEN, AND WHAT WORKS

Falls happen at home. A home visit prevents them.

54%

of falls among people over 65 happen at home.

ISS · PASSI d'Argento 2023–2024

11%

were advised by a doctor on how to avoid them.

ISS · PASSI d'Argento 2023–2024

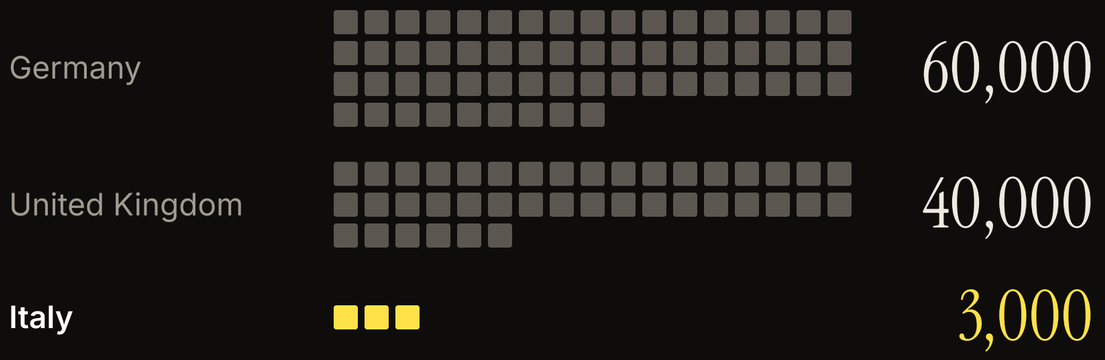

−38%

falls when an occupational therapist inspects the home and hazards are removed, in high-risk older adults.

Cochrane review 2023 · 22 studies, 8,463 people

THE BOTTLENECK

In Italy, that expert is missing.

Occupational therapists. Each square = 1,000. Source: FNO TSRM e PSTRP, 2024.

1 therapist for every ~5,000 people over 65.

«If an occupational therapy assessment is not available, review potential home hazards with the patient and family.»

CDC STEADI, at every discharge. **Step Wise makes it possible, with an expert eye.**

THE SOLUTION

From phone photos to a plan the family can act on.

Three AI models do the slow inspection. The professional has the last word.

01

Capture

A relative photographs the home with a phone. The nurse adds the patient's profile.

FAMILY · NURSE

02

Detection

Jev answers atomic questions: is there a rug, a cable, a bathtub? Each with its box.

TYPESAFE JEV

03

3D room

VGGT turns the photos into a room the reviewer can walk through.

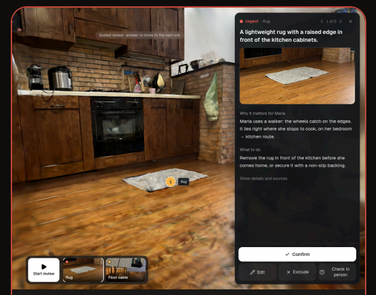

VGGT-1B

04

Reasoning

Gemma ranks the hazards and explains why each matters for this patient.

GEMMA 4 31B

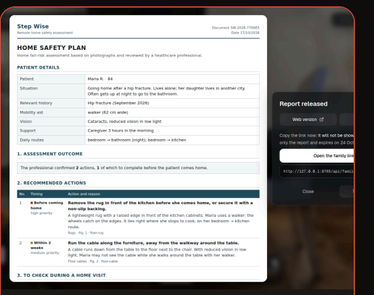

05

Review

The discharge nurse confirms, edits, excludes or defers each finding.

PROFESSIONAL

06

Family plan

Approved actions, by priority, in plain language, on the family's phone.

FAMILY

01 CAPTURE · 03 3D RECONSTRUCTION

From flat photos to a room.

VGGT is a transformer that looks at all the photos at once. In a single pass it works out where each one was taken from, how far away every pixel is, and where it sits in space.

1. **Camera poses**: where each photo was taken
2. **Depth**: the distance of every pixel
3. **3D points**: the room, with each hazard in its place

`VGGT-1B · Meta, CVPR 2025` `Gaussian splatting · gsplat` `PyTorch · ROCm`

↓ 39 phone photos

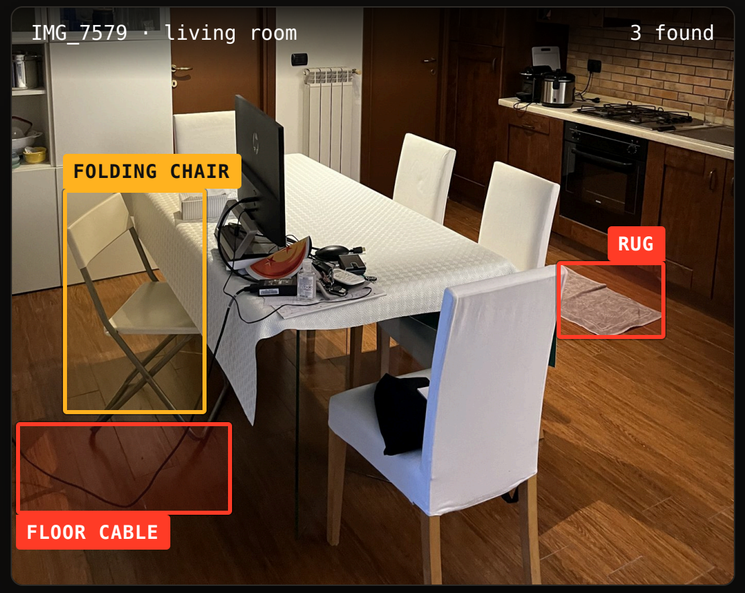

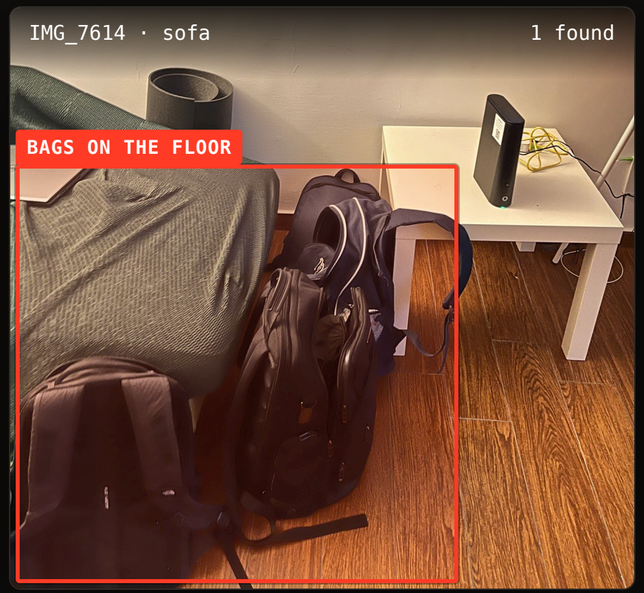

Real output: 39 phone photos of a real home, camera poses from VGGT-1B, 757,792 Gaussians trained with gsplat. The photographs remain the evidence; the 3D view helps the reviewer navigate. Scale not yet calibrated.

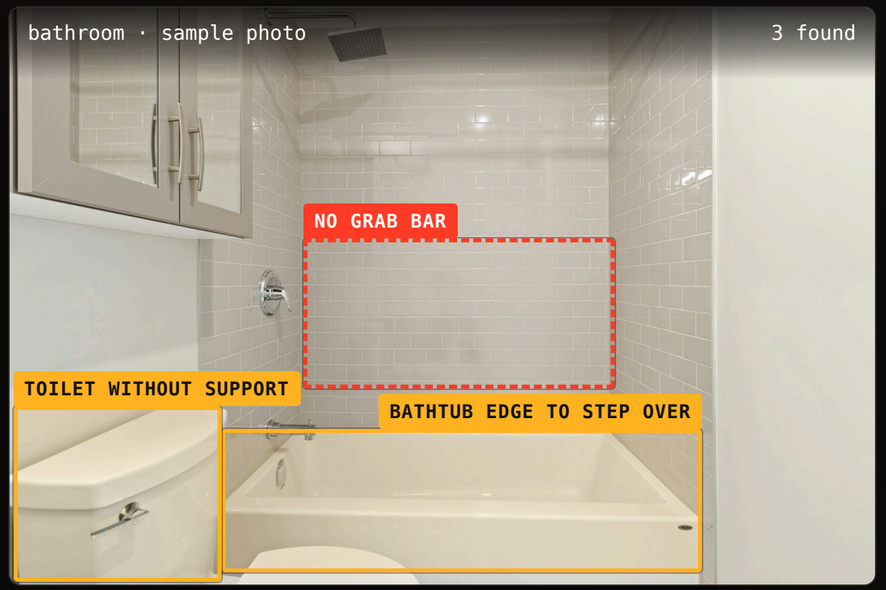

02 DETECTION

Every hazard, with its evidence.

Jev answers atomic questions on the areas of the **Westmead Home Safety Assessment**. A box counts only when presence is confirmed; what a photo cannot show stays “to check in person”.

question
Is there a cable on the floor?
→ **yes** · box [0.01, 0.72, 0.31, 0.88]

question
Is there a grab bar next to the bathtub?
→ **no** · area without support

question
Is the floor slippery?
→ **cannot tell** · check in person

Living room and sofa: real photos of the home used in the demo. Bathroom: Point3D Commercial Imaging Ltd. / Unsplash. Boxes are illustrative.

04 REASONING

Why it matters, for Maria.

Gemma reads the evidence and the confirmed profile, ranks the hazards by urgency and explains why. Every claim must point to a photo and a guideline.

CONFIRMED PROFILE

Walker · hip fracture · lives alone · gets up at night

EVIDENCE

The hazards found in the photos, each with its box

GUIDELINES

CDC STEADI

Gemma 4 31B

Google DeepMind
running on AMD

PRIORITY

Urgent, before coming home · or within weeks

WHY, FOR THIS PATIENT

“The walker's wheels catch on the rug's edge, on her daily route.”

WHAT TO DO

A plain-language action, linked to its photo and source

05 REVIEW

The professional decides.

The discharge nurse sees each hazard with its photo, its place in the room and the reason. Minutes, not a home visit.

Confirm
goes into the family plan

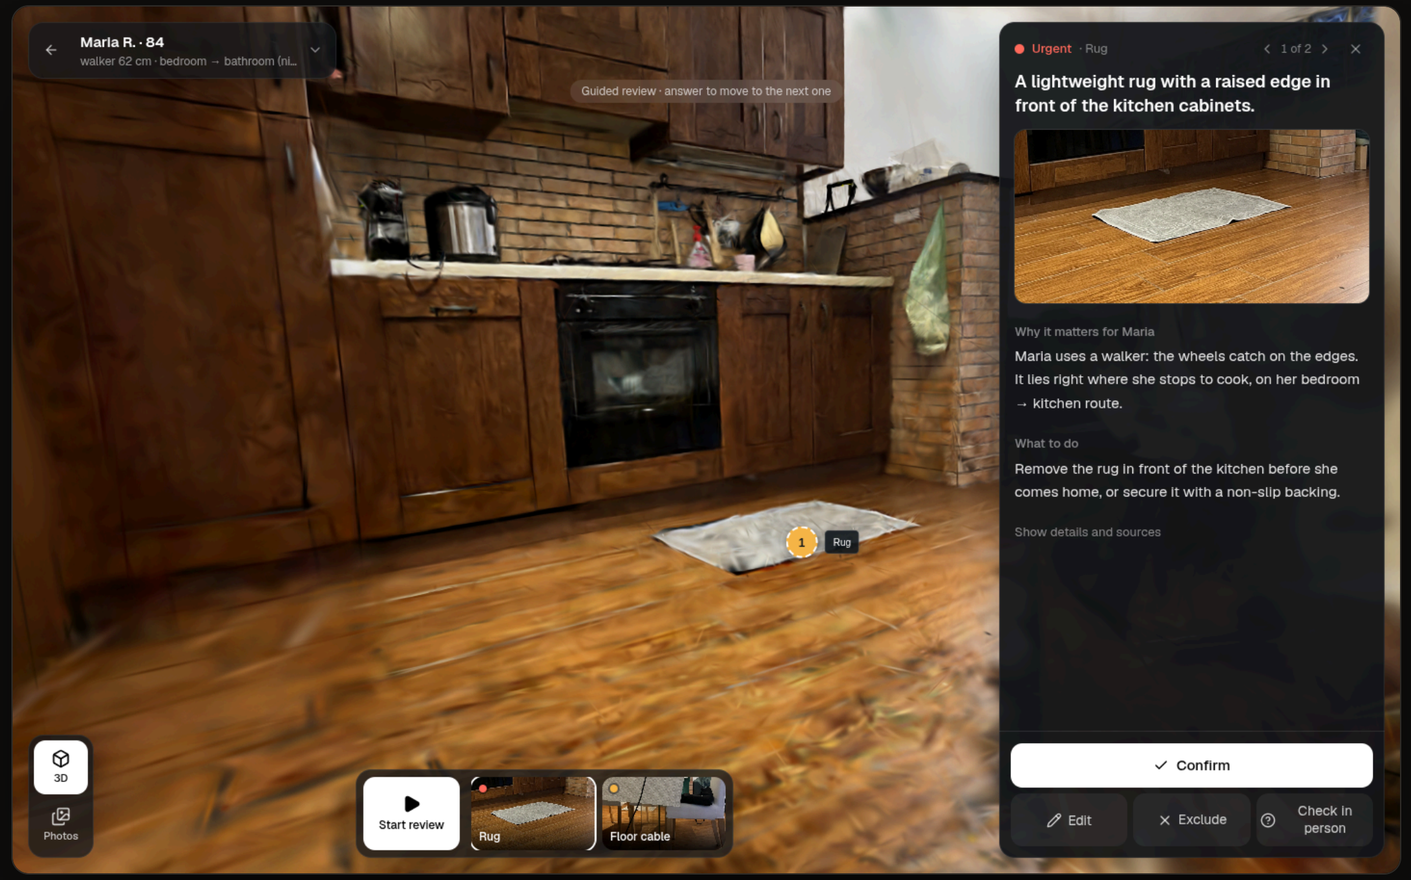

Edit
change the action or the wording

Exclude
never reaches the family

Check in person
left for the first home visit

Nothing reaches the family without her sign-off.

`Next.js · three.js` `versioned reviews`
`release blocked if a decision changes`

Real prototype screen: guided review inside the room reconstructed from 39 photos. In this demo case the two hazards were marked by hand by the team.

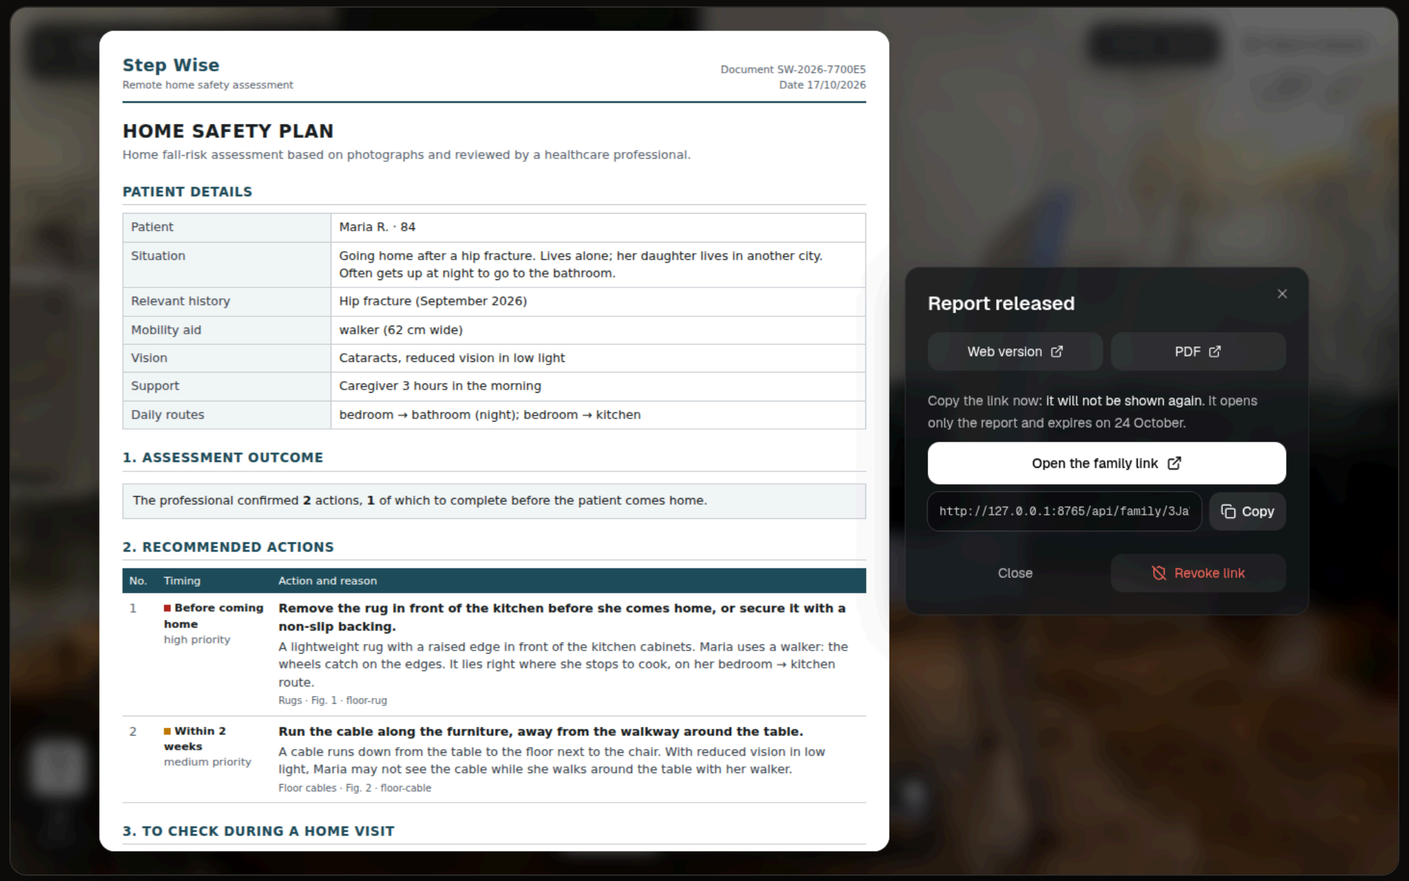

06 FAMILY PLAN

The family knows what to do.

Maria's daughter gets the approved plan on her phone: actions in order of priority, in plain language, each with its photo. Before Maria comes home, not after the next fall.

1. **Only confirmed hazards** enter the plan
2. **What the photos cannot assess** is listed for the home visit
3. **Private link**: expires in 7 days, can be revoked
4. **Same document** as web page and PDF, with a fingerprint

`Jinja2 · WeasyPrint` `HTML + PDF`

Real prototype screen: the generated home safety plan, released to the family with a private link.

WHY AMD

One GPU, inside the hospital.

Home photos and clinical data cannot go to just any cloud. The 192 GB of one MI300X hold both the 3D reconstruction and the model that reasons about the patient: everything stays inside the hospital.

01 · CAPTURE

Photos + profile

Upright orientation, metadata stripping, quality checks.

`FastAPI · Pillow · NumPy`

03 · RECONSTRUCTION

VGGT-1B

Camera poses, depth and 3D points.

`PyTorch · ROCm`

04 · REASONING

Gemma 4 31B

Checks, priorities, plan.

`vLLM · ROCm`

AMD Instinct MI300X · 192 GB HBM3

`ROCm · reconstruction and model on the same GPU · one job at a time`

02 · Detection: Jev 1.14, external API, receives only prepared photos with no patient data · 05–06 · Review and report: Next.js, three.js, WeasyPrint

11.00 s

four images in a single call

WHO IT IS FOR

Built around the discharge, not around the AI.

USES IT

The discharge nurse

Reviews a home in minutes, from the ward, before the patient leaves. Decides what goes to the family.

BENEFITS

The patient and the family

A clear plan before coming home. A relative takes the photos; the same relative receives the actions.

ADOPTS IT

Hospitals and local health services

Their discharge pathway gains the home review the CDC recommends, on hardware they control.

Fills a real gap

With one occupational therapist for every ~5,000 people over 65, the real alternative to a home visit is no assessment at all.

Uses the scarce expert well

“Check in person” sends to a home visit only what the photos cannot settle.

Fits clinical rules

A professional signs off every finding; data stays inside the hospital.

On Friday, Maria goes home.

This time, someone looked at the hallway.
